

a Binarization reproduces the reference notebook bit-for-bit
(8 recordings $\times$ 4 neurons + combined state series, all identical)

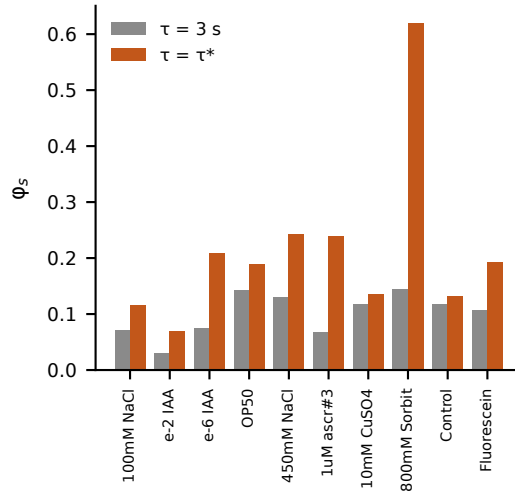

b ϕ_s rises toward the epoch limit

c τ^* moves with the epoch:
0 of 10 stimuli agree

d ϕ_s at τ^* vs at $\tau = 3$ s
(mean 0.214 vs 0.100)

e Sign flips again; still null
