

Regimes differ at the TPM level ($z = 35$) and — at full-volume noise — at specific Φ states (0000 $\downarrow$, 1000 $\uparrow$, 1111 $\uparrow$ under stim-on); static $\approx$ stim-off

a $\Sigma\phi$ per state under each TPM (full data)

b Full-volume bootstrap: on/off agreement falls below within-regime reproducibility

c Quiescence- Φ deflation under stim-on IS resolvable at full volume; static $\approx$ off
