

a Raw traces DO discriminate:
AWAL $d=0.72$, AIBL $d=-0.41$ (Holm *)

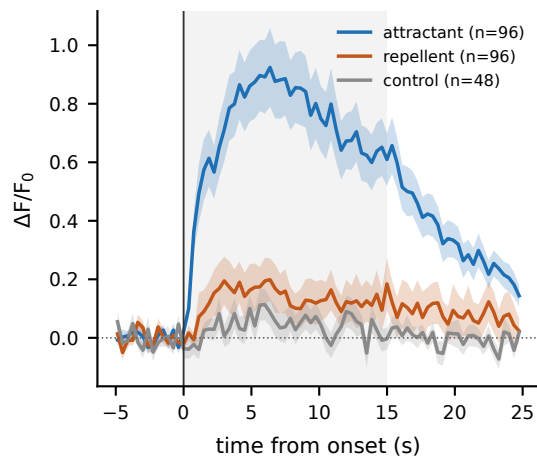

b No pipeline clears its own
noise floor (all ratios ≤ 1.06)

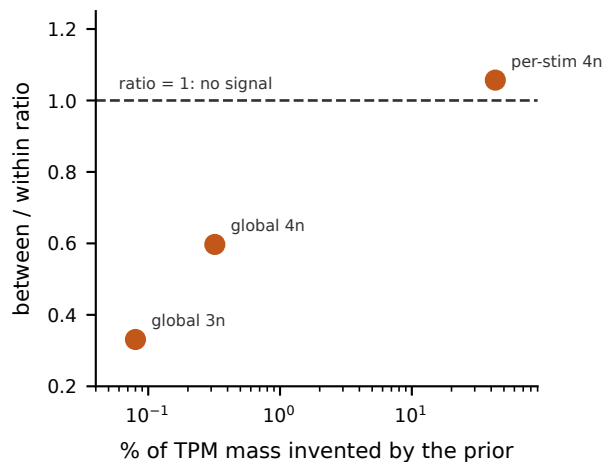

c POSITIVE CONTROL FAILS:
chemical present vs absent invisible

d AWAL, all 8 animals:
clean attractant selectivity

e Better conditioning makes it
WORSE, not better

f Exact distance moves every p
FURTHER from significance
