

The concern, isolated: a controlled, tiny TPM perturbation barely moves the distinctions but rewrites a third of the relations

a Yes: $\sim 150\times$ amplification.
D(structure) vs a KNOWN tiny Δ TPM

b The 15 distinctions barely move
(median $|\Delta\phi| = 0.0012$, no flips)

c ...while 590 RELATIONS flip existence under the same 1.2% perturbation
